

Topics:

⇒ **Slds [Salesforce lightning design system][Aura & web]**

⇒ **CSS Styles**

⇒ **Custom settings**

-==> Using custom settings a user can predefine some error message or some type of messages and use it in every component.

⇒ User can create custom settings through setup org and user can pass a value to lwc component.

⇒ Value can be any string or integer

⇒ Custom label : are some custom text to show any messages. Value can be accessed by Vfpage or Lwcomponent.

⇒ **Static Resource**

Communication between components

⇒ Communication between two components in that case one component is child and one component is parent.

⇒ How to pass message from Parent to child component.

⇒ To do communication there are two ways:

→ Child to parent → LMS[lightning messaging service]

→ Parent to child → Use of public property using public property adaptor that is @api[decorator]

→ For private properties user use @ track but after release 2020, no

@track
